

APIFONICA

Overview of Apifonica SDKs

VOICE API

Incorporate enterprise-grade voice calling features into any app

TALK TO SALES

Using Apifonica Client:

Easily use Apifonica APIs in the programming language . Download and install helpers for iOS, Android, Node.js.

- Web SDK
- iOS Mobile SDK
- Android Mobile SDK

PRODUCTS

Ready to integrate into your web, mobile, or desktop app

Web SDK

This Web SDK provides an easy way to use Apifonica service with REST APIs, to rent numbers, to create XML, and do other common server-side programming tasks. The Web SDK consists of two parts: the server-side path and the Web Phone demo project.

[Server-side packet](#)[Web Phone \(VoIP\)](#)

iOS Mobile SDK

iOS SDKs enable you to rent phone number, make VoIP phone calls, receive push notification message. Get started with the SDK you need.

[CallOut VoIP](#)[Apache Cordova plugin with native VoIP](#)[Push Notification service](#)

Android Mobile SDK

Android SDKs enable you to rent phone number, make VoIP phone calls, receive push notification message. Get started with the SDK you need.

Web SDK

This Web SDK provides an easy way to use Apifonica service with REST APIs, to rent numbers, to create XML, and do other common server-side programming tasks. The Web SDK consists of two parts: the server-side path and the Web Phone demo project.

Server-side packet

Web Phone (VoIP)

Overview

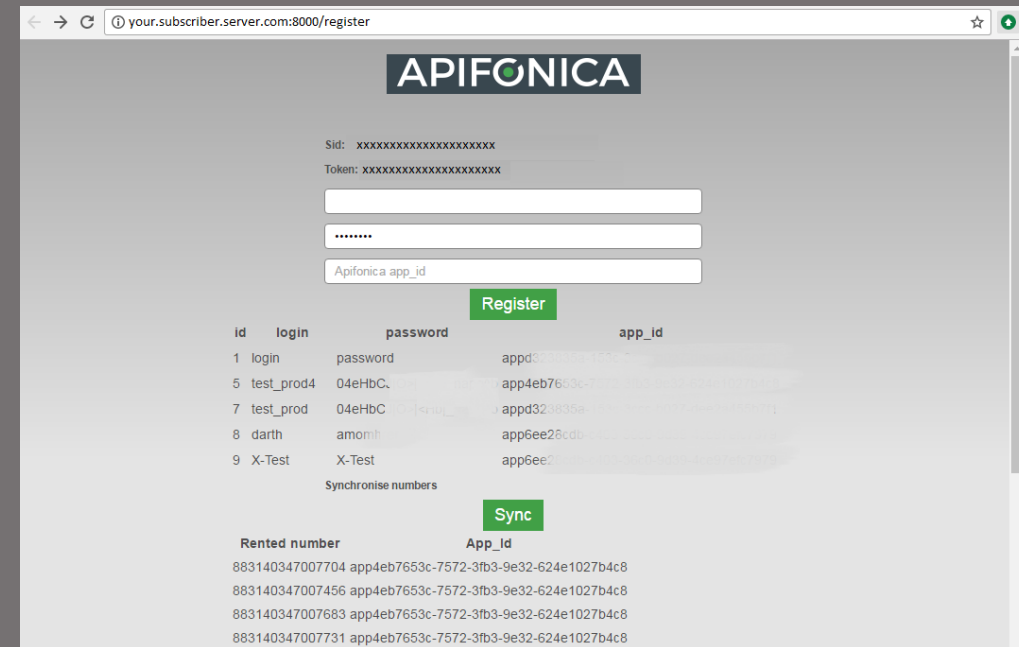

The server-side path of Web SDK uses for monitoring and connection between Mobile (iOS/Android), WebPhone devices and Apifonica service.

Requirements:

- * npm installation
- * Node.js
- * MySQL or PostgreSQL

Features:

- * Server management and its interaction with Mobile SDK apps and Apifonica server;
- * Monitoring of the rented phone numbers;
- * Monitoring Incoming/OutGoing Calls via XML scenarios;
- * Synchronize the rented numbers stored on the your server-side with rented numbers stored in your Apifonica account.

Web SDK

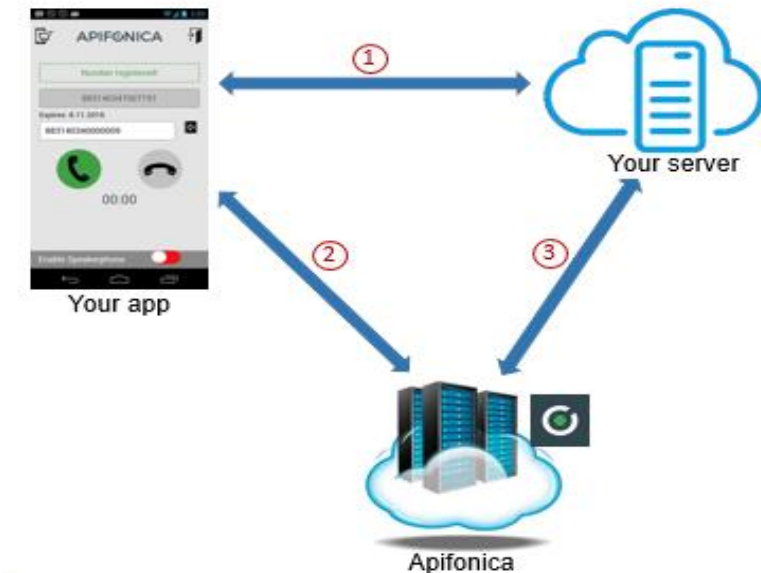

This Web SDK provides an easy way to use Apifonica service with REST APIs, to rent numbers, to create XML, and do other common server-side programming tasks. The Web SDK consists of two parts: the server-side path and the Web Phone demo project.

Server-side packet

Web Phone (VoIP)

Architecture

- 1) Your app initiates communications with your server via REST APIs for rent number and requests a Capability (JWT) Token
- 2) Your app talks with Apifonica to register with it's services and make/receive VoIP connections
- 3) Apifonica talks with your server to get XML or your server initiates communications with Apifonica via REST APIs for rent number

[Server-side packet](#)[Web Phone \(VoIP\)](#)

Overview

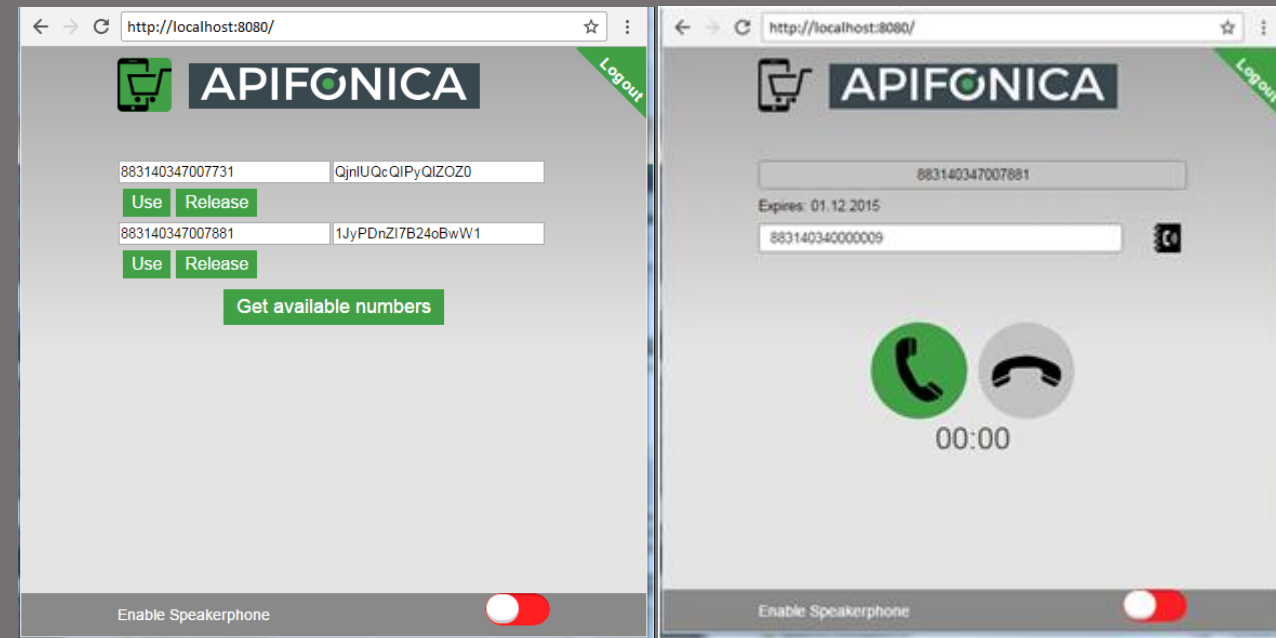

The Web Phone packet is demo project which it contains functions to rent phone number, make VoIP phone calls in the customer web browser on the base of WebRTC.

Requirements:

- * npm installation
- * Node.js
- * MySQL or PostgreSQL

Features:

- * Rent of phone number;
- * Supports incoming/outgoing VoIP calls on the base of WebRTC service;
- * Audio connection with audio codecs (OPUS/G722/G711(u/a-law)/SHA-256);
- * Supports Google Chrome, Firefox Mozilla, Safari browsers.

iOS Mobile SDK

iOS SDKs enable you to rent phone number, make VoIP phone calls. Get started with the SDK you need.

[CallOut VoIP](#)[Apache Cordova plugin with native VoIP](#)[Push Notification service](#)

Overview

CallOut is a test application designed to show Apifonica API and Mobile SDK capabilities of VoIP service provisioning that could be added to client mobile applications.

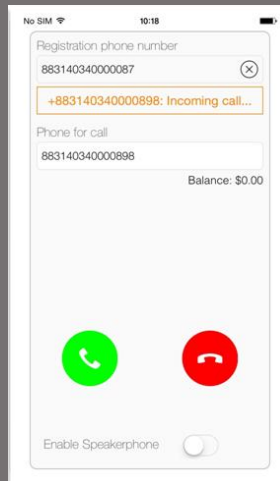

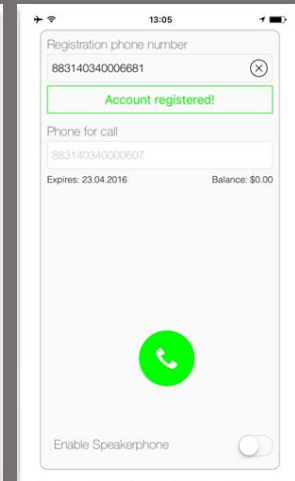

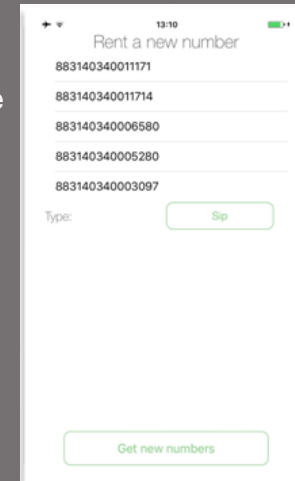

The CallOut application can be installed on iPhone or iPad devices specified by the customers. The CallOut app demonstrates renting a phone number with "SIP" type. The application allows to make outgoing calls and to receive incoming calls. It is necessary that the iPhone device has access to 3G/4G/LTE network and/or to Wi-Fi.

Requirements:

- * Xcode 5 or higher
- * iPhone 4 or higher
- * iPad 2 or higher.

Features:

- * Wi-Fi and 3G/4G/LTE connections
- * Service with rent of phone number
- * Incoming/outgoing VoIP audio sessions
- * Audio connection with audio codecs (OPUS/SILK/speex/GSM/iLBC/G722/G711(u/a-law)).
- * Supports background mode.

iOS Mobile SDK

iOS SDKs enable you to rent phone number, make VoIP phone calls. Get started with the SDK you need.

CallOut VoIP

Apache Cordova plugin with native VoIP

Push Notification service

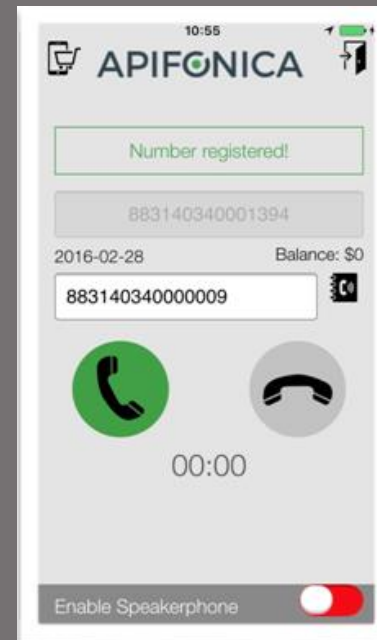

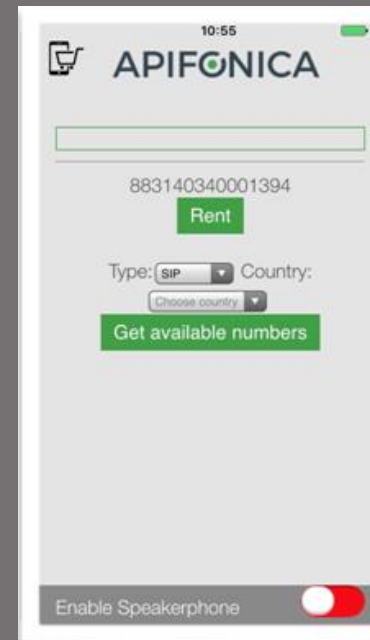

Overview

HelloApifonica is a test application designed to show Apifonica VoIP service capabilities by means of Apache Cordova plugin and Apifonica Mobile SDK. This test application demonstrates the VoIP functionality that could be added to client mobile applications developed by using the WebView (HTML/JavaScript) system component. The application is tested by making calls between the allocated SIP numbers by using the HelloApifonica app. It is necessary that the your device has access to 3G/4G/LTE network and/or to Wi-Fi.

[CallOut VoIP](#)[Apache Cordova plugin with native VoIP](#)[Push Notification service](#)

Overview

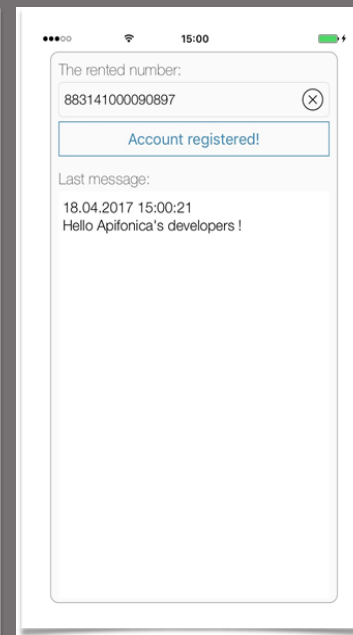

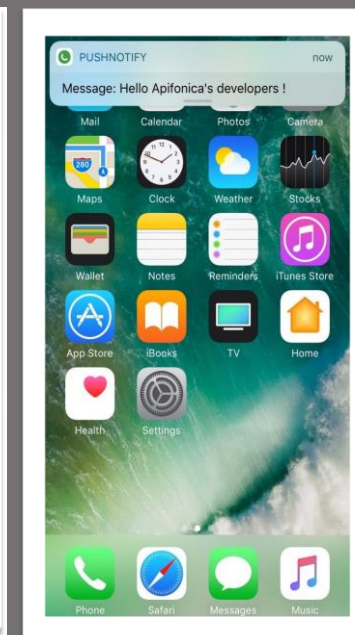

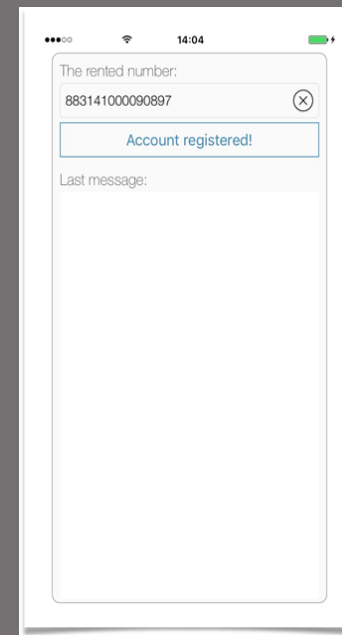

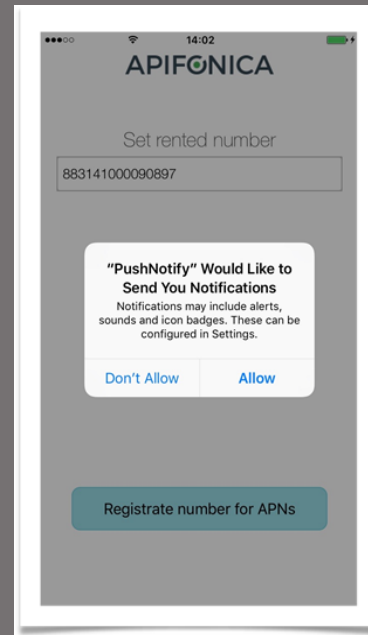

PushNotify is a test application designed to show interaction between Apple Push Notification service, Server-side SDK and Apifonica server. The test project also demonstrates authorization process of rented number with device-token for APNs service and shows how to receive push notification message.

Requirements:

- * Xcode 5 or higher
- * iPhone 4 or higher
- * iPad 2 or higher.

Features:

- Supports Apple APNs or Apple Voip Service of Push Notification
- Easy integration in target app

Push Notification service

Overview

PushNotify is a test application designed to show interaction between Google Firebase cloud messaging (FCM) service, Server-side SDK and Apifonica server. The test project also demonstrates authorization process of rented number with device-token for FCM service and shows how to receive push notification message with FCM service.

Requirements:

- * The last version of Android Studio.
- * To configure your App project with a [Firebase Consolle](#).

Features:

- * Wi-Fi and 3G/4G/LTE connections
- * Service with rent of phone number
- * Incoming/outgoing VoIP audio sessions
- * Easy integration in target app

The first screenshot shows a list of phone numbers: 883140347007336, 883140347007007, 883140347007145, 883140347007148, 883140347007344, 883140347007954, 883140347007371, and 883140347007511. At the bottom is a button labeled 'RENT A NEW NUMBER'.

The second screenshot shows the app interface with the following text: 'your number: 883140347007954', 'expires after: 28/06/2017', a 'LOG OUT' button, and 'Last message:'. At the bottom, a dark grey box contains the text: 'Push token was registered successfully !'.

The third screenshot shows the app interface with the following text: 'your number: 883140347007954', 'expires after: 28/06/2017', a 'LOG OUT' button, and 'Last message: 2017.06.27 15:59:09 test 01'. At the bottom, a dark grey box contains the text: 'Got message: 2017.06.27 15:59:09 test 01'.
